

BUILDING THE SUSTAINABLE FUTURE OF AFRICA

This talk is from 2017. It reflects on how science can be a way forward for development in Africa in its own right but in becoming more embedded in projects which deal with novel habitation, integrated utilities and climatic resilience.

3D printing technologies are emphasised and shown to have relevance to housing, food, healthcare and transport.

Creating capable villages, applying Social Business models and financing are all considered.

Innovation is considered crucial and entirely feasible.
